

# Thyroid Nodule Treatment Center

## RICHARD J HARDING MD FACS

Dear Colleague,

A non-surgical option for treating patients with symptomatic thyroid nodules is now available. As an endocrine surgeon I have been performing thyroid surgery for over twenty-six years. During the years I have been performing Thyroid Nodule RFA (Radiofrequency Ablation) the dramatic change in thyroid nodule size has impressed both me and my patients. The patients experience relief of their symptoms while retaining their thyroid function, without thyroid surgery!

Patients who suffer from large benign symptomatic thyroid nodules may now undergo a procedure performed under local anesthesia in my office. The rapid decrease in the nodule size provides the relief of symptoms. Additionally, autonomously functioning nodules previously treated with thyroid lobectomy or radioactive iodine now may achieve immediate relief with a targeted procedure.

### Patients to refer:

- Patients with symptoms of choking, foreign body sensation (lump in throat), difficulty breathing, hoarseness, chronic coughing
- Enlarging thyroid nodules over 2 cm
- Visible deformity from an enlarged thyroid nodule
- Toxic thyroid nodules

Sincerely,

**Richard J Harding MD**  
Endocrine and General Surgeon
